## # SQL Sales Data Analysis Project - Detailed Analysis

# ## | Project Overview

This SQL project demonstrates comprehensive sales data analysis for an e-commerce/sales database, covering database creation, data querying, complex joins, subqueries, analytical functions, views creation, and performance optimization.

# ## 📻 Database Structure

### ### Core Database

- \*\*Initial Setup\*\*: Creates `e\_commerce` database (immediately dropped), then creates and uses `sales` database
- \*\*Primary Table\*\*: `sales.data` Contains transactional sales data with multiple dimensions

## ### Supporting Table

- \*\*`customers\_info`\*\*: Customer master data with loyalty program information
- Contains 17 customer records with CustomerID, CustomerName, Email, and LoyaltyLevel
- Note: One customer (Vikram Singh, ID 12584) has no corresponding sales records

# ## | Key Analytical Components

#### ### 1. \*\*Basic Data Exploration\*\*

- \*\*Column Selection\*\*: Extracts key business columns (InvoiceNo, StockCode, Description, Quantity, UnitPrice, Country)
- \*\*Filtering\*\*: UK customer segmentation using WHERE clause
- \*\*Sorting\*\*: Product pricing analysis with ORDER BY (descending price)

#### ### 2. \*\*Aggregate Analysis\*\*

- \*\*Country Performance\*\*: Identifies top purchasing countries by quantity
- \*\*Sales Value Analysis\*\*: Top 5 countries by total sales value (quantity × unitprice)
- \*\*Customer Segmentation\*\*: Groups data by country and customer for behavioral analysis

#### ### 3. \*\*Advanced SQL Operations\*\*

## #### \*\*JOIN Operations\*\*

- \*\*INNER JOIN\*\*: Matches sales records with existing customer info (excludes non-matching)
- \*\*LEFT JOIN\*\*: All sales records with customer info where available
- \*\*RIGHT JOIN\*\*: All customer records with sales data where available (shows customers without purchases)

#### #### \*\*Subgueries Implementation\*\*

- 1. \*\*Price Analysis\*\*: Customers purchasing above average unit price
- 2. \*\*Customer Activity\*\*: Identifies active customers from sales data
- 3. \*\*Volume Analysis\*\*: Products with above-average quantity sales
- 4. \*\*High-Value Transactions\*\*: Invoices exceeding \$50 total value
- 5. \*\*Purchase Frequency\*\*: Countries with customers making >2 purchases
- 6. \*\*Inactive Customers\*\*: Bonus query finding customers with no purchases

## ### 4. \*\*Business Intelligence Metrics\*\*

- \*\*Total Sales Value\*\*: Overall business performance
- \*\*Product Performance\*\*: Average quantity sold per product
- \*\*Invoice Analysis\*\*: Total value per transaction
- \*\*Customer Value\*\*: Average spending per customer
- \*\*Geographic Performance\*\*: Sales breakdown by country
- \*\*Pricing Strategy\*\*: Average unit price across products
- \*\*Top Customers\*\*: Highest spending customers (top 3)

## ## T Database Optimization

#### ### \*\*Views Creation\*\*

- 1. \*\*Customer Sales View\*\*: Total spending per customer
- 2. \*\*Product Performance View\*\*: Average quantity metrics
- 3. \*\*Invoice Summary View\*\*: Transaction value aggregation
- 4. \*\*Geographic Performance View\*\*: Country-level sales
- 5. \*\*Customer Loyalty View\*\*: Purchase behavior with loyalty tiers
- 6. \*\*Inactive Customers View\*\*: Non-purchasing customers

### ### \*\*Performance Indexing\*\*

Strategic indexes implemented for:

- \*\*CustomerID\*\*: Primary join key optimization
- \*\*InvoiceNo\*\*: Transaction lookup efficiency
- \*\*InvoiceDate\*\*: Time-based query performance
- \*\*Composite Index\*\*: Customer-country filter combinations
- \*\*Description\*\*: Product search optimization

# ## Q Key Business Insights Generated

#### ### \*\*Sales Performance\*\*

- Total revenue calculation capabilities
- Country-wise sales distribution
- Customer spending patterns

## ### \*\*Customer Behavior\*\*

- Loyalty program member purchasing patterns
- Identification of inactive customers
- Purchase frequency analysis

#### ### \*\*Product Analysis\*\*

- Pricing strategy evaluation
- Sales volume per product
- High-value product identification

## ### \*\*Operational Efficiency\*\*

- Invoice value analysis
- Transaction pattern recognition

- Database query optimization

# ## X Technical SQL Features Demonstrated

## ### \*\*Advanced SQL Concepts\*\*

- Multiple JOIN types with practical use cases
- Complex subqueries for segmented analysis
- Aggregate functions with GROUP BY operations
- Conditional filtering with HAVING clause
- View creation for simplified reporting
- Performance optimization with indexes

## ### \*\*Data Quality Considerations\*\*

- Handles missing customer data (RIGHT JOIN reveals gaps)
- Manages duplicate records with DISTINCT
- Validates business rules through subqueries

# ## // Potential Business Applications

- 1. \*\*Sales Reporting\*\*: Automated revenue and performance reports
- 2. \*\*Customer Segmentation\*\*: Targeted marketing based on purchasing behavior
- 3. \*\*Inventory Management\*\*: Product performance monitoring
- 4. \*\*Geographic Expansion\*\*: Market potential analysis by country
- 5. \*\*Loyalty Program Optimization\*\*: Reward strategy based on customer value
- 6. \*\*Performance Monitoring\*\*: Query optimization for large datasets

This project demonstrates a complete analytical pipeline from raw data to business insights, showcasing both foundational and advanced SQL techniques suitable for real-world sales analytics applications.
